in presence / absence of drug candidates

INFECTION MODELS

Caenorhabditis elegans

Murine model

COMPARATIVE QUANTITATIVE PROTEOME ANALYSES

of infected hosts in the absence and presence of drug candidates

global changes in protein expression in both the host and the pathogen in response to the drug treatment

„METAPROTEOMICS"

Advantage: genomic sequence of hosts and pathogens is available.

MOTIVATION & HYPOTHESES

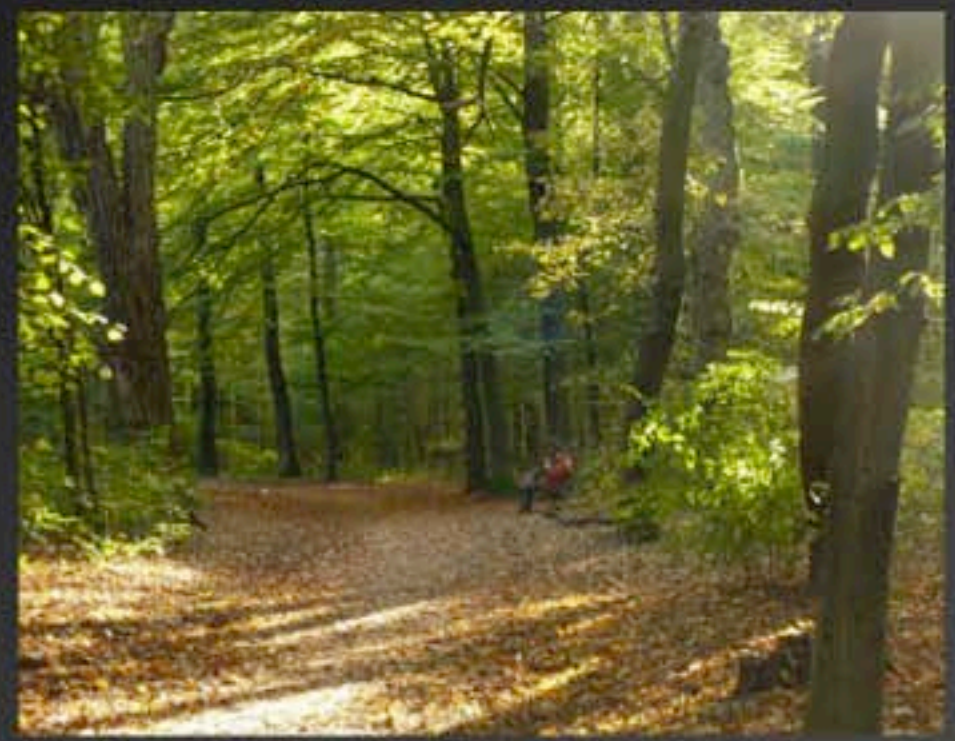
- **Yearly litter production:**

  ~ 10^{11} t (Drymass)

  Large pool of organic carbon, nitrogen & phosphorous

- **Global mean steady state turnover time:**

  ~ 1.4 to 3.4 years



HYPOTHESES

- ⇨ in most aerobic habitats fungi are the main degraders of litter
- ⇨ in anaerobic habitats or in environmental niches with increased temperature, bacteria contribute to litter decomposition
- ⇨ community structure and function is influenced by leaf-litter biogeochemistry

PROTEIN ASSIGNMENT & QUANTIFICATION

MS & MS/MS data

Database search (Mascot, X-tandem)
Data filtering and sorting (Scaffold:
95% peptide probability, 1 unique peptide)

Clusters of proteins identified by the same set of peptides

Quality control: cluster homology
(> 50% homology)

Validated clusters of proteins identified by the same set of peptides

Assignment to phylogenetic groups
according to UniPROT NEWT taxonomy
Quality control - cluster consistency

Validated clusters assigned to a certain phylogenetic group

Assignment to functional groups according
to KEGG, KOG, COG, and SWISS PROT
Quality control - cluster consistency

Validated clusters assigned to a certain functional group

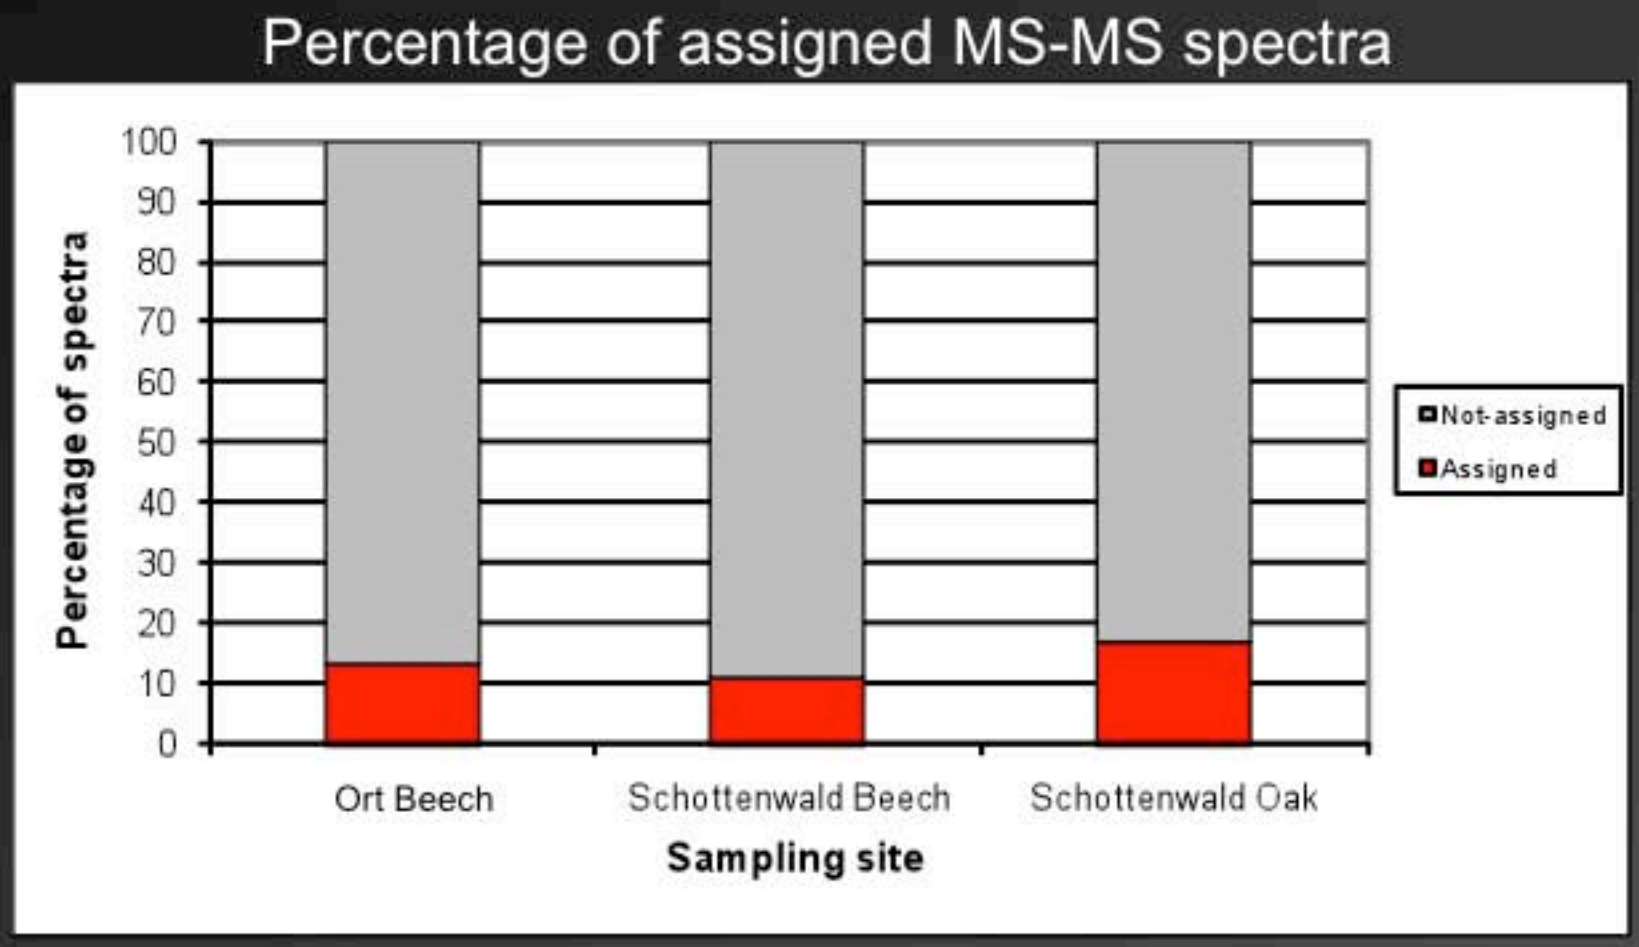
Quantification by counting of unique spectra assigned to taxonomic or functional groups

Emanuel Schmid

Data analysis pipeline using PERL based scripts

DRAWBACKS & CHALLENGES

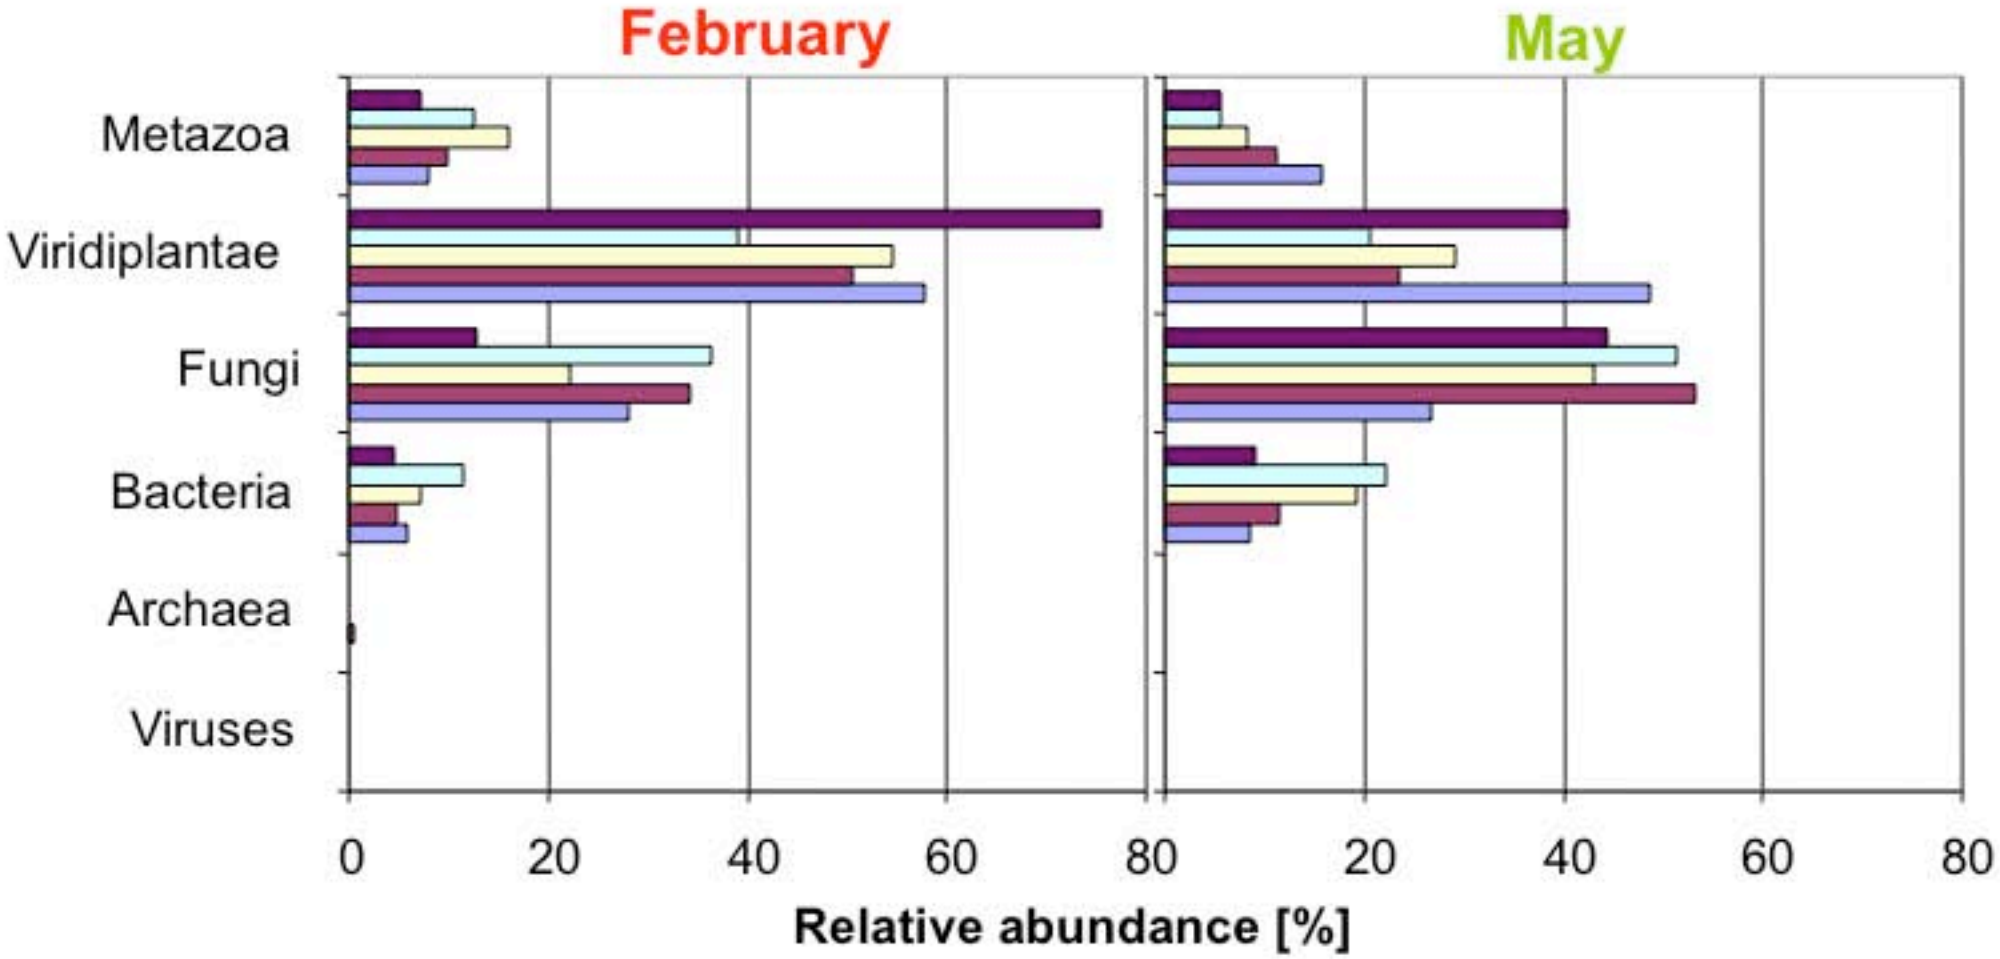
- number of acquired MS/MS-spectra: ~300,000
- number of proteins: ~1200



⇨ 90% of the spectra do not match to any protein in the reference database

⇨ database has to be improved (metagenomics & metatranscriptomics sequence data)

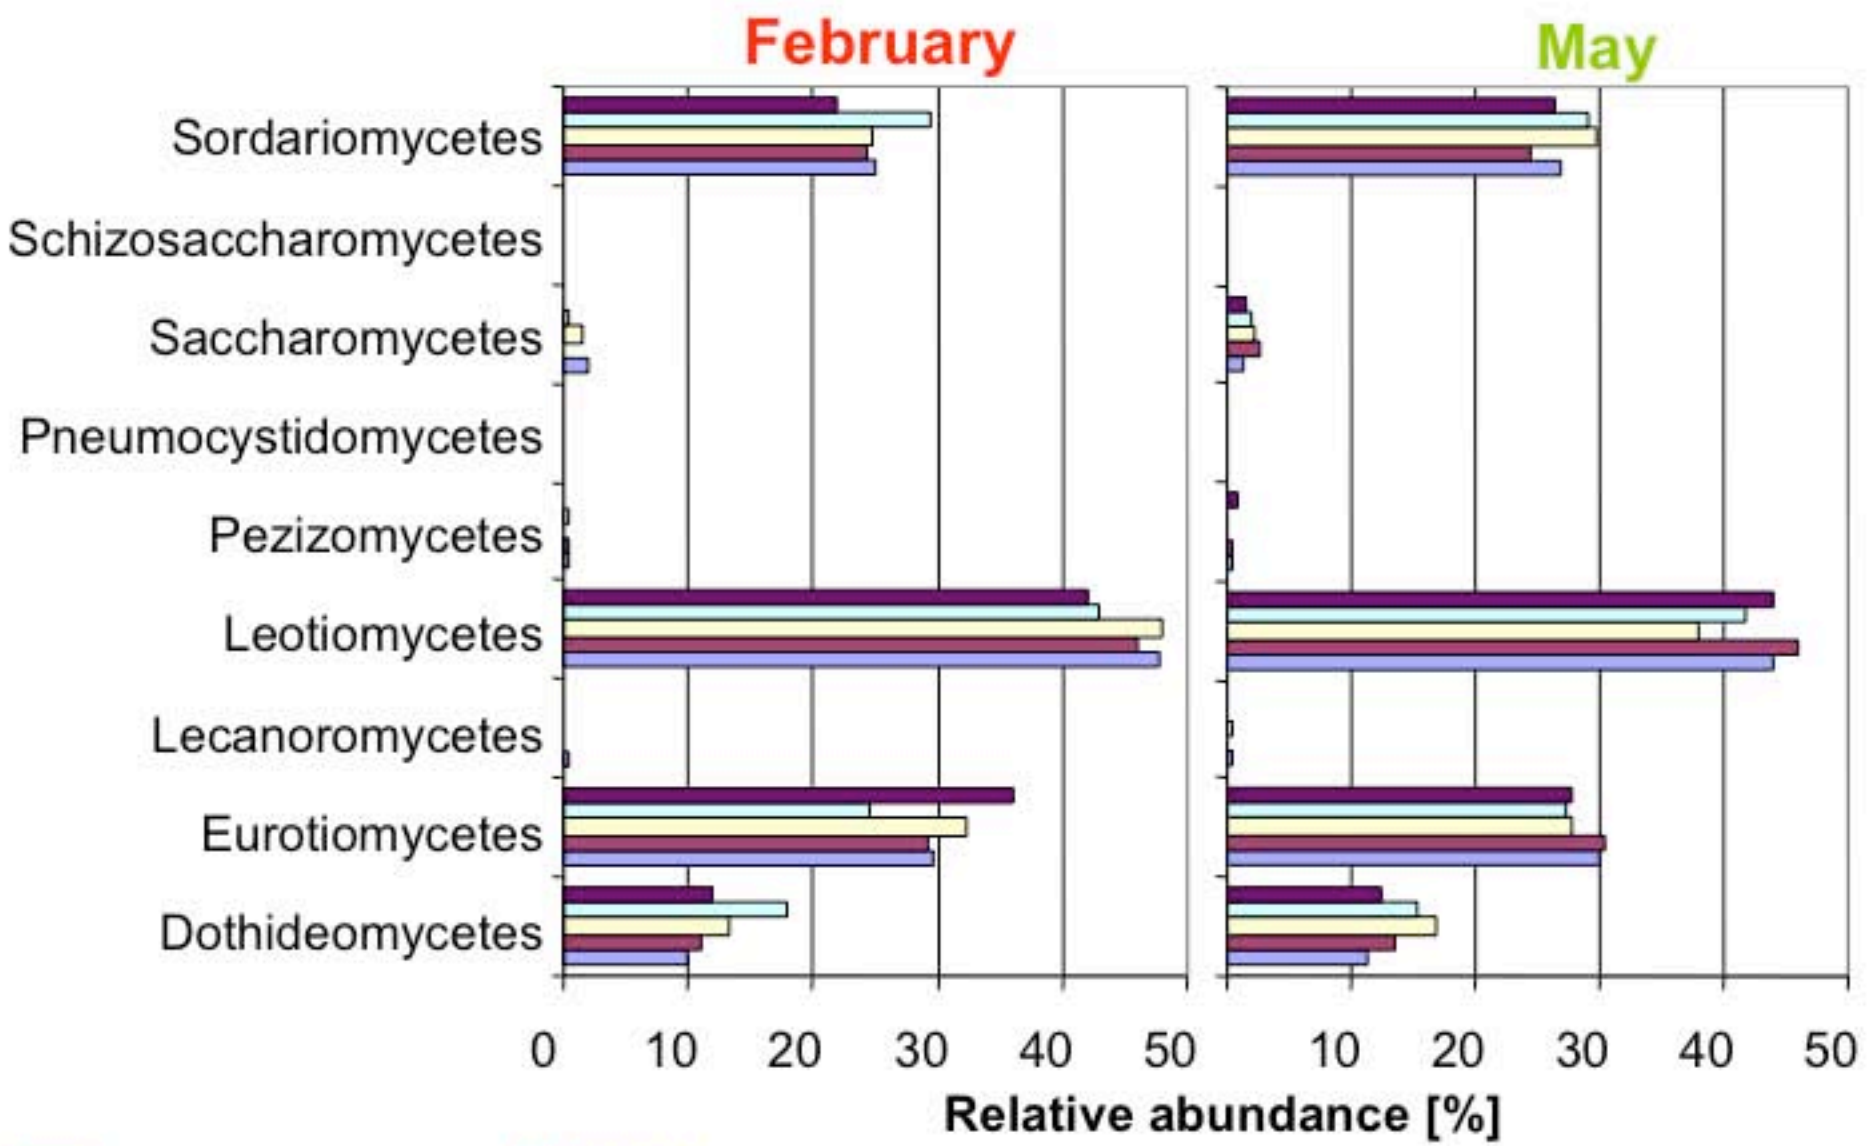
COMMUNITY STRUCTURE - OVERVIEW



- Schottenwald oak (422/1347)
- Schottenwald beech (649/1609)
- Klausen Leopoldsdorf beech (591/1375)
- Ort beech (673/1839)
- Achenkirch beech (955/2292)

Quantification is based on the numbers of unique spectra

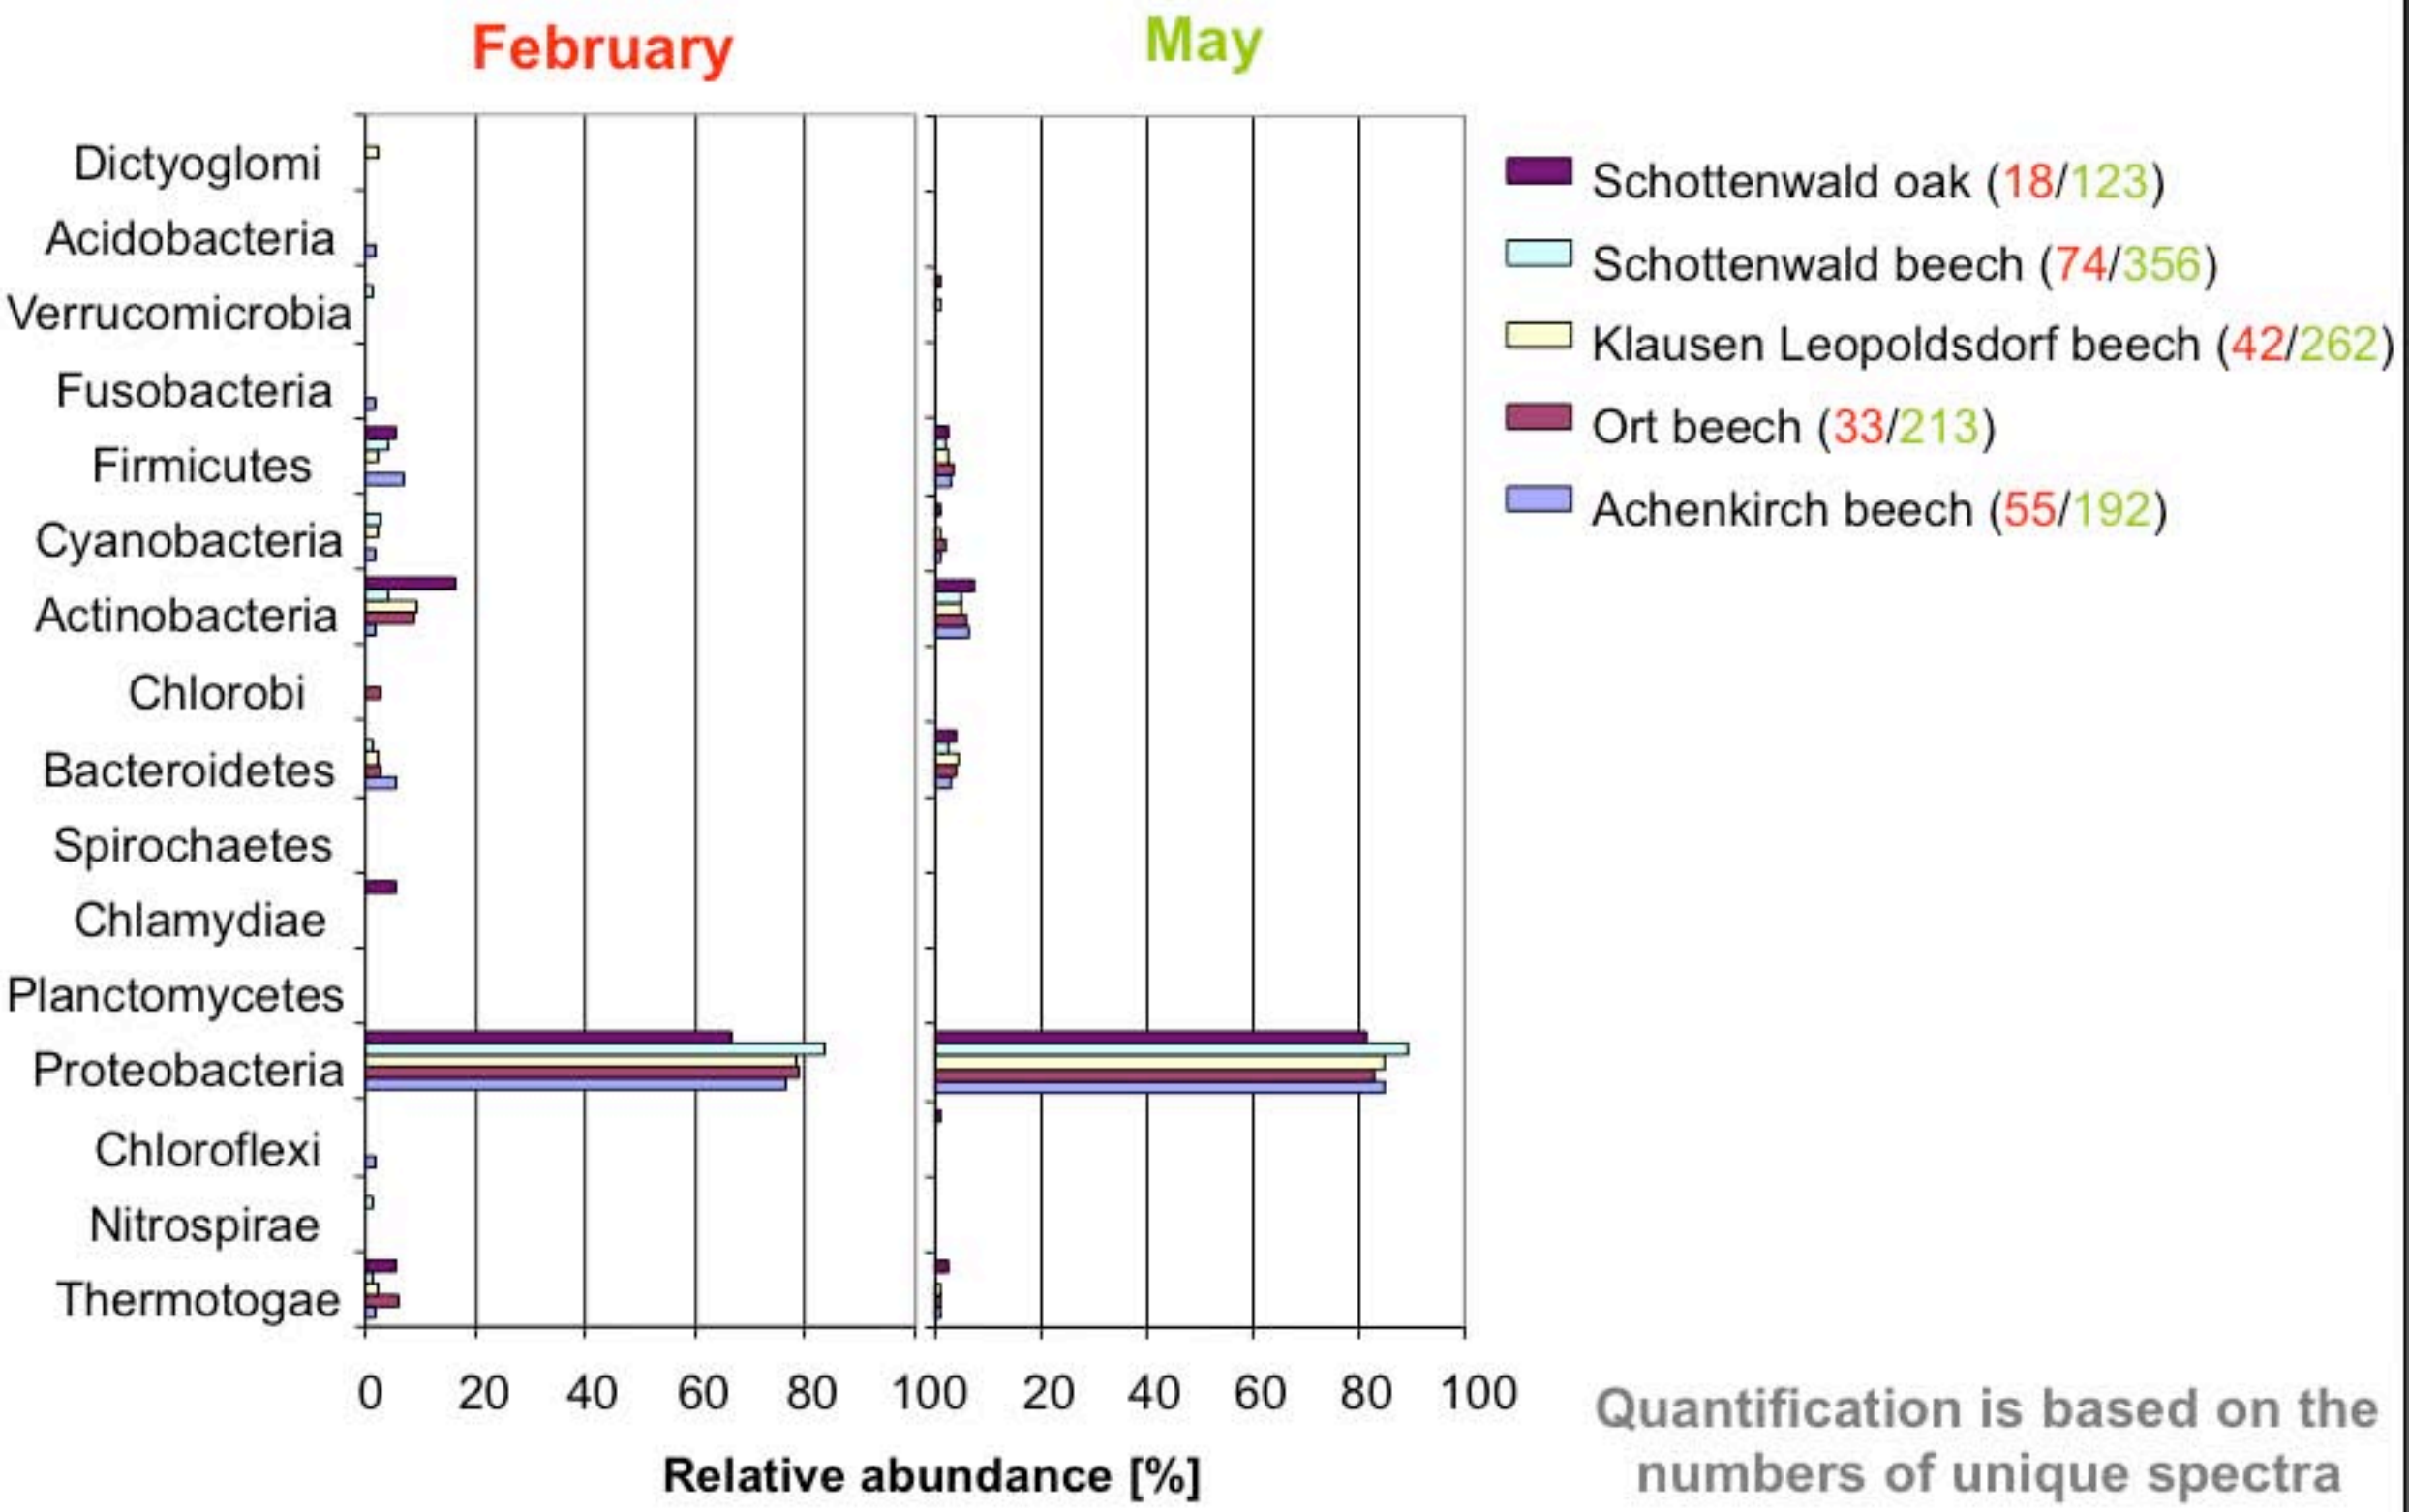
COMMUNITY STRUCTURE - FUNGI



- Schottenwald oak (50/524)
- Schottenwald beech (228/713)
- Klausen Leopoldsdorf beech (121/512)
- Ort beech (226/801)
- Achenkirch beech (259/505)

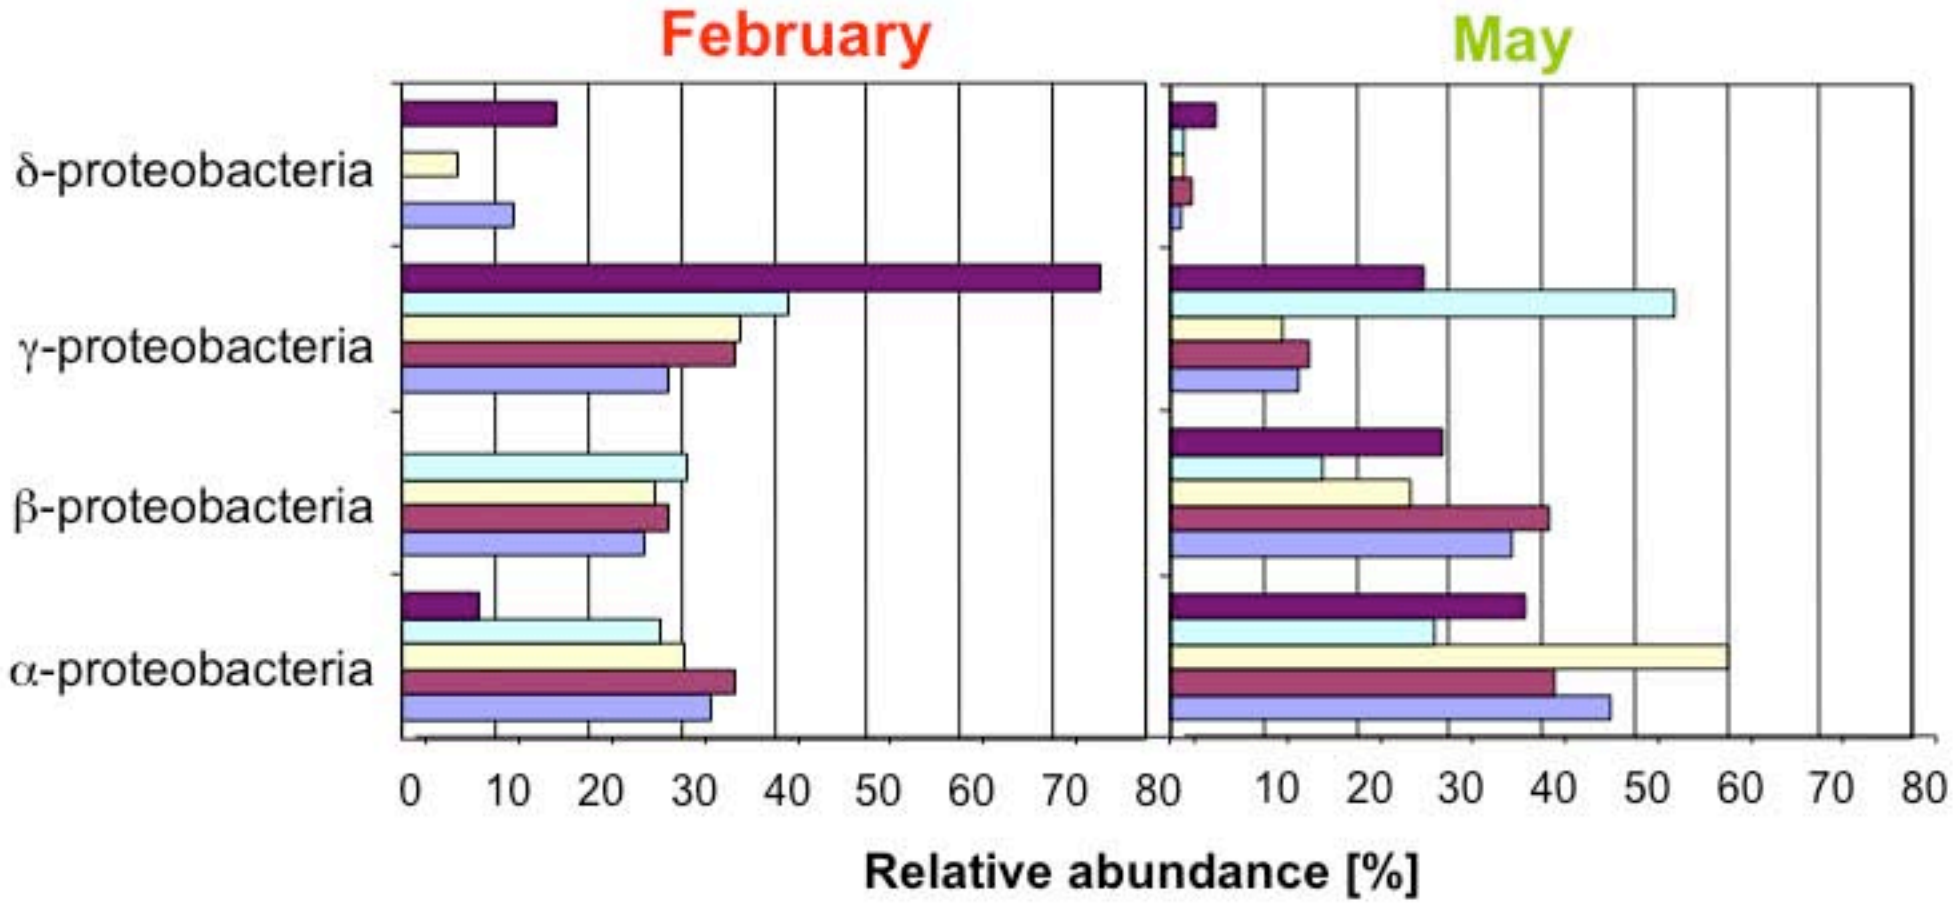
Quantification is based on the numbers of unique spectra

COMMUNITY STRUCTURE - BACTERIA



Quantification is based on the numbers of unique spectra

COMMUNITY STRUCTURE - BACTERIA

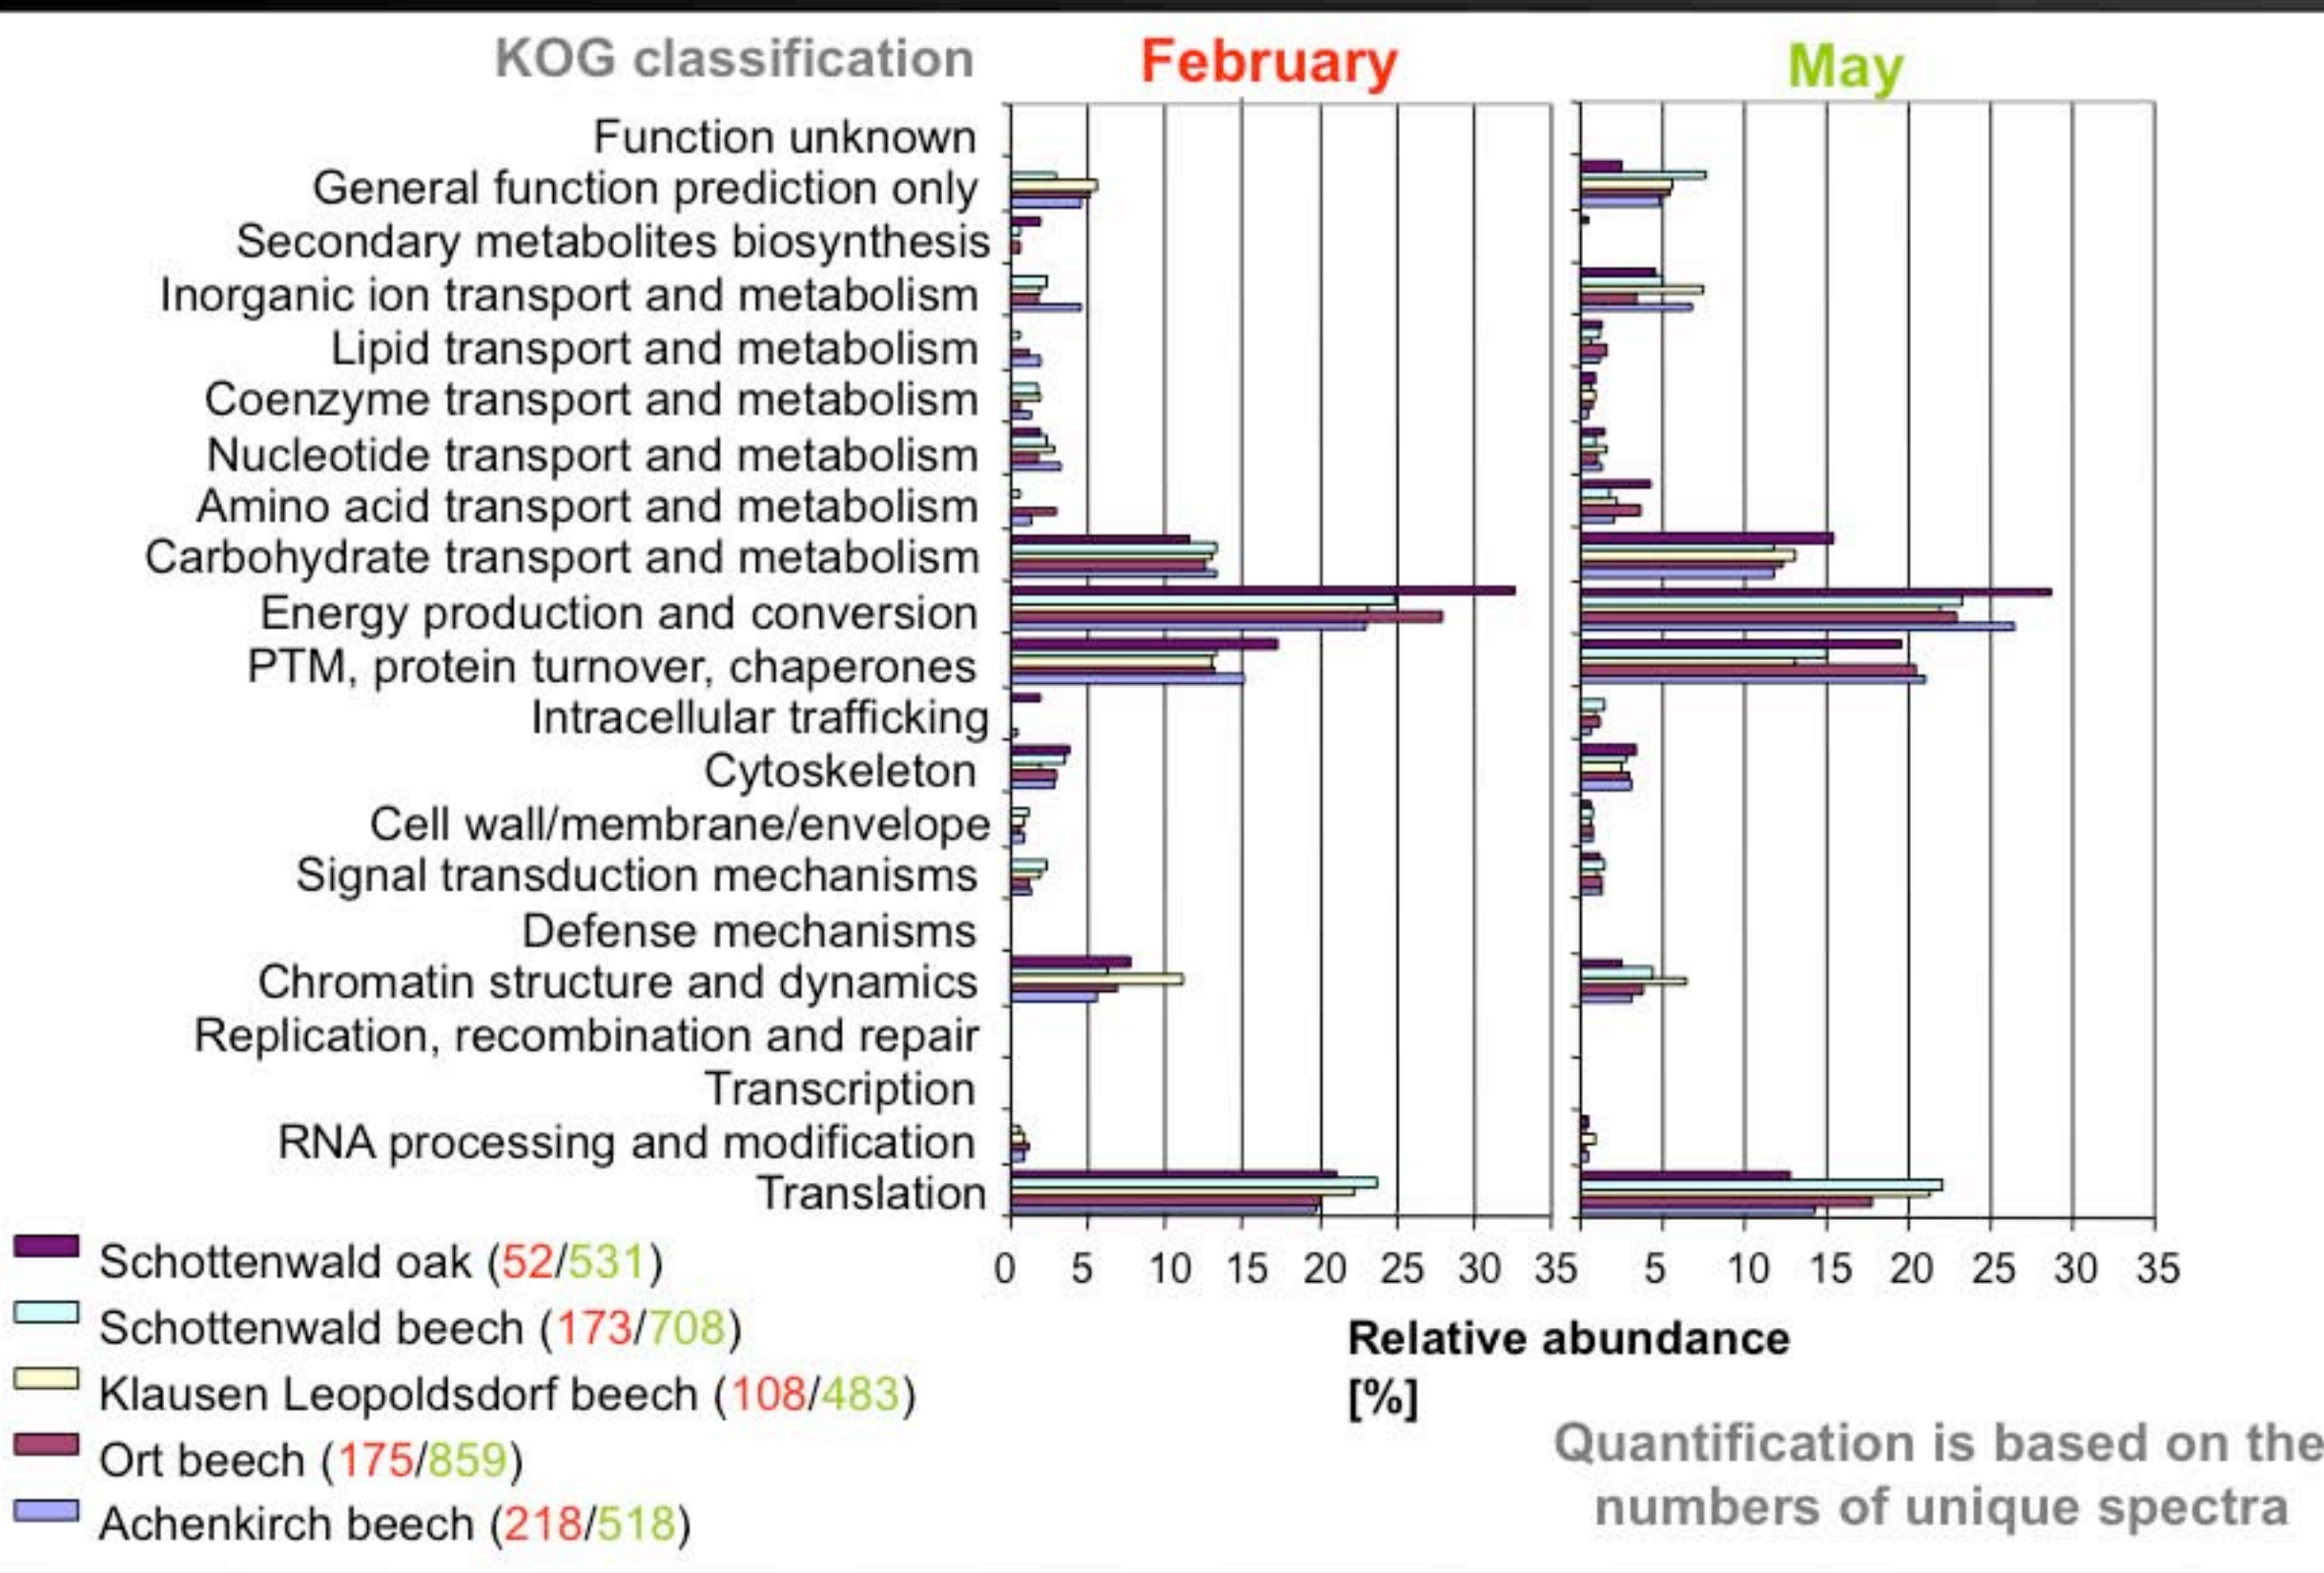


- Schottenwald oak (12/102)
- Schottenwald beech (65/322)
- Klausen Leopoldsdorf beech (33/223)
- Ort beech (28/179)
- Achenkirch beech (42/166)

Quantification is based on the numbers of unique spectra

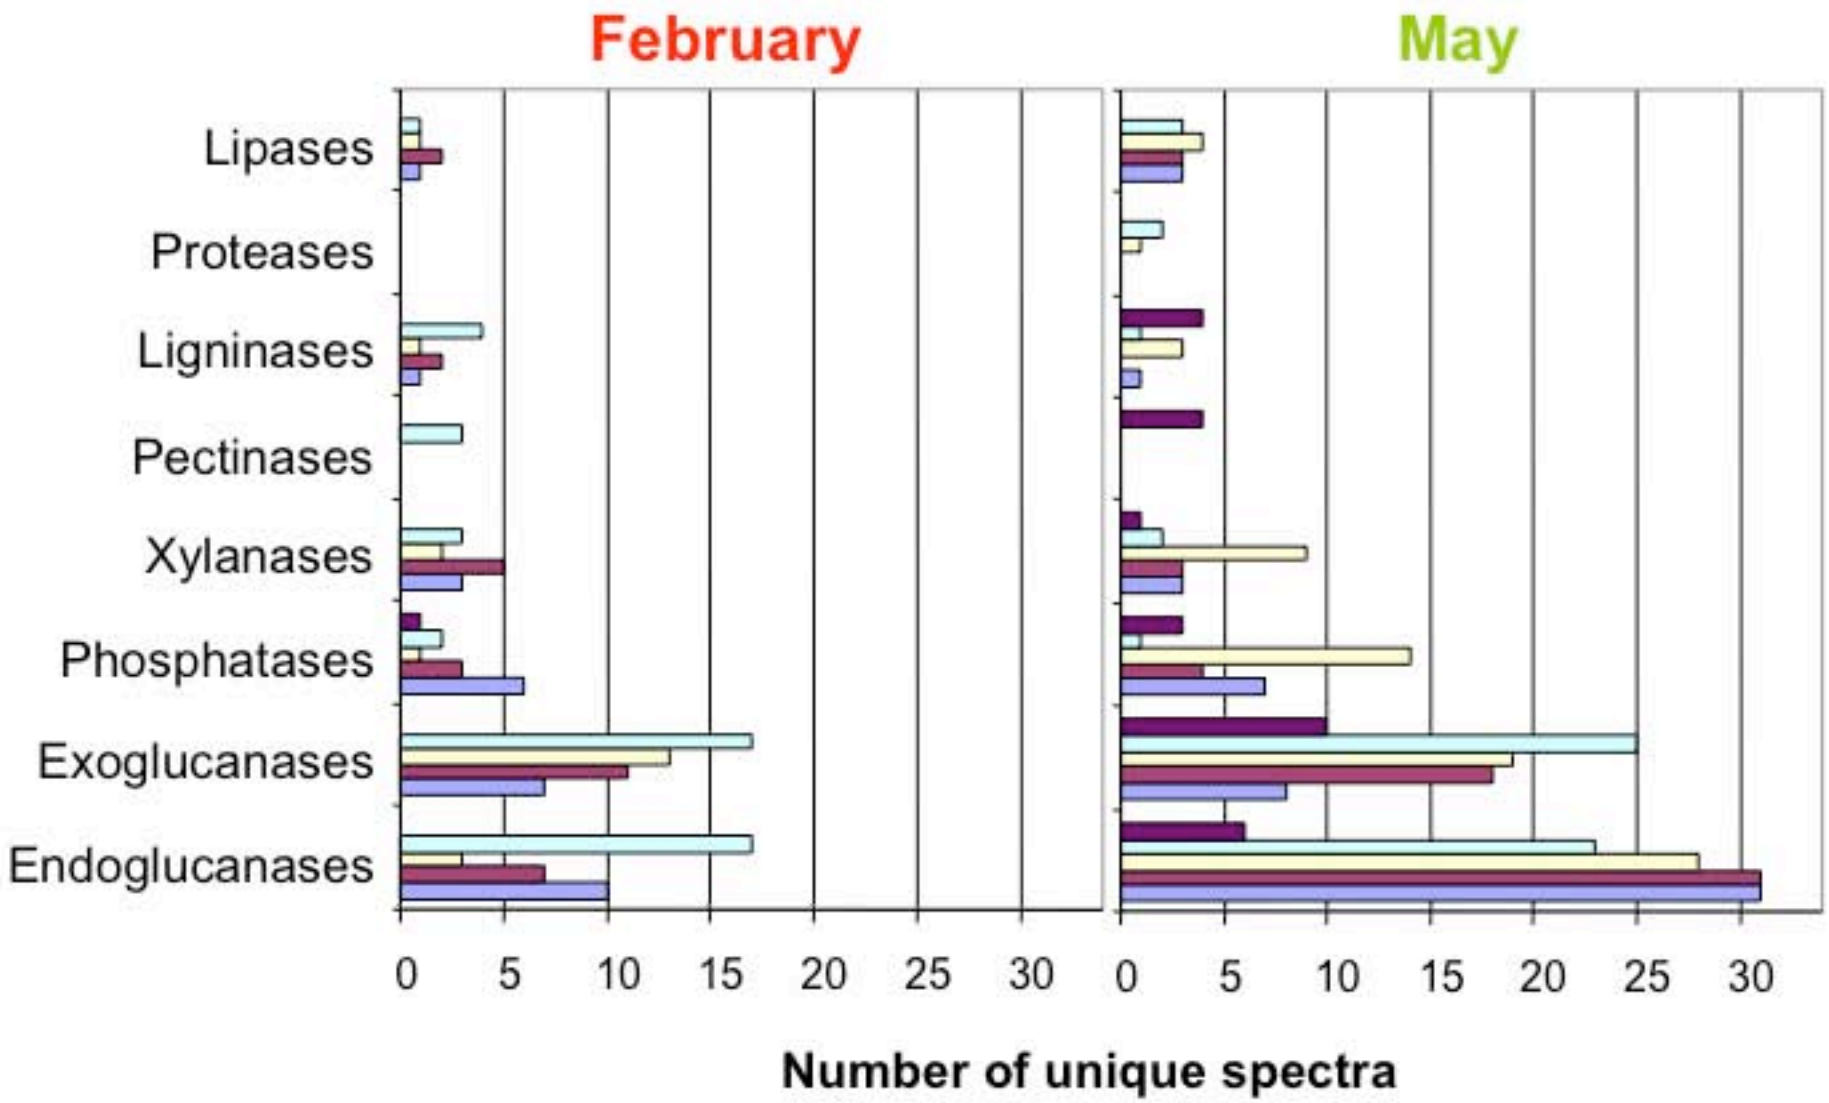
Microbial Proteomics
UZH

COMMUNITY FUNCTION - FUNGI



Quantification is based on the numbers of unique spectra

COMMUNITY FUNCTION – FUNGAL EXOENZYMES



Hydrolytic enzymes are only of fungal origin

- Schottenwald oak
- Schottenwald beech
- Klausen Leopoldsdorf beech
- Ort beech
- Achenkirch beech

Quantification is based on the numbers of unique spectra

IMPACT OF LITTER BIOGEOCHEMISTRY?

Sampling site Litter type		N	P	Mn	Plant Proteins	Fungal Proteins	Bacteria Proteins	Fungal Exoenzymes
Achenkirch	Feb	+++	+	+	+++	++	+	++
Beech	May	++	+	+	+++	++	++	+++
Klausen-Ld.	Feb	++	+	++	++	++	+	+
Beech	May	+	+	++	+	+++	+++	+++
Ort	Feb	+	++	++	++	+++	+	++
Beech	May	++	++	++	+	+++	++	++
Schottenwald	Feb	+++	+++	+++	+	+++	++	+++
Beech	May	+++	+++	+++	+	+++	+++	+++
Schottenwald	Feb	+++	++	+++	+++	+	+	(+)
Oak	May	++	++	++	++	++	++	++

+, ++, and +++ refer to relative abundances between different sampling & litter types

BFW, Vienna

⇨ increase in protease-, cellulase-and xylanase-activities from Feb to May confirm semi-quantitative proteome data

PHOSPHOLIPID FATTY ACIDS (PLFA) ANALYSES

⇨ increase of the fungal community from Feb to May at Ort and Schottenwald (high in Mn and P) corresponds well to the semi-quantitative proteome analysis

⇨ no temporal changes in the community at Achenkirch and even a decrease in the fungal/bacterial ratio at Klausen-Leopoldsdorf (low in P and Mn); similar trends were reflected in our unique spectral counts

CONCLUSIONS – COMMUNITY STRUCTURE

- ⇨ generally, the same taxonomic groups were found at all sampling sites & litter types
- ⇨ the dominant taxa were plants, fungi, and bacteria
- ⇨ while plant proteins decreased, fungal and bacterial proteins increased from Feb to May at sampling sites with high P and Mn
- ⇨ a lower number of microbial spectral counts were observed in samples with low P and Mn concentration or of structurally inert leafs (oak); especially bacterial growth seems to be limited by phosphorus
- ⇨ while the composition of the fungal community appeared unchanged between Feb and May, the proteobacterial community seemed to shift from δ- and γ- towards α- and β-proteobacteria

CONCLUSIONS – COMMUNITY FUNCTION

⇨ under aerobic conditions fungi seem to be the main degraders of beech litter

⇨ bacteria are present, but seem not to degrade the litter (cheaters); they might play a more important role in anaerobic microniches or at later time points of the degradation process

⇨ less litter degradation enzymes were expressed when either P or Mn were limited (and thus fungal growth was limited)

⇨ more fungal phosphatases were expressed at lower P concentrations

The presence of a certain taxonomic group does not necessarily mean that it participates in a particular functional process, i.e. litter decomposition
